Prince Uche

Backend, Full-Stack & AI Systems Engineer with a strong passion for designing and developing scalable, intelligent, and high-performance software systems that bridge modern backend infrastructures with dynamic user-centric applications. Experienced in architecting end-to-end solutions across frontend, backend, cloud, and AI-driven ecosystems, with a focus on building resilient platforms, automation pipelines, distributed services, and production-grade applications capable of handling real-world scale and complexity. Skilled in developing robust APIs, intelligent automation systems, cloud-native applications, and modern full-stack architectures using clean engineering principles, optimized system design, and scalable development methodologies. Passionate about leveraging artificial intelligence, advanced backend engineering, and modern web technologies to create innovative products that improve efficiency, solve complex operational challenges, and deliver seamless digital experiences. Strong understanding of software architecture, database systems, DevOps workflows, CI/CD pipelines, performance optimization, security practices, and scalable infrastructure design. Adept at transforming ideas into reliable, maintainable, and future-ready systems through strategic problem-solving, analytical thinking, and continuous innovation. Driven by curiosity, adaptability, and a commitment to engineering excellence, with a deep interest in emerging technologies, intelligent systems, automation, cloud computing, and next-generation software development practices. Continuously focused on building impactful technology solutions that combine performance, scalability, reliability, and exceptional user experience.

TECHNICAL EXPERTISE

• Docker • Redis • Axum • Tokio

Backend Engineering

Designing scalable APIs, microservices, authentication systems, database architectures, and performance-oriented backend infrastructures.

AI Systems

Building intelligent automation systems, AI integrations, chatbot infrastructures, and adaptive software solutions.

Distributed Systems

Working with real-time systems, secure communication flows, peer-to-peer concepts, and scalable backend operations.

System Architecture

Interested in designing maintainable software structures, backend workflows, scalable infrastructures, and developer-focused engineering systems.

PROFESSIONAL EXPERIENCE

Freelance Software Developer

REMOTE • FULL STACK & BACKEND ENGINEERING

- Designed and developed modern full-stack applications with scalable backend systems and optimized database structures.
- Built intelligent software systems using modern APIs, automation logic, and performance-focused architectures.
- Managed software lifecycles including architecture planning, debugging, testing, optimization, and deployment.
- Worked extensively with SQL and NoSQL databases, API integrations, authentication systems, and real-time communication flows.
- Applied modern engineering practices focused on scalability, maintainability, and secure infrastructure development.

Backend engineer passionate about AI systems, distributed applications, automation, and scalable software infrastructure. Continuously exploring modern technologies and building performance-focused solutions with strong real-world impact.
